

Symon Design Studio Lite

Symon Design Studio Lite™ is a Web-based software application that allows you to create and send messages to flat panel displays and Symon InView desktop clients.

It is used with Symon's visual communications eco-system and works with Symon Design Studio content management software. Symon Design Studio Lite consists of three main components:

Priority Messaging

Allows you to temporarily take over the entire screen of a flat panel display (LCD and plasma) and Symon InView desktop clients to show an urgent pre-built message; you can copy, change a message and send it out. The original message is not changed or deleted.

Dynamic Messaging

Allows you to choose and play a pre-built message on a video display. Use this feature for employee notification and reminder messages. The original message is not changed or deleted.

Message Explorer

Allows you to see all of your available messages on the Symon Enterprise Server you have been given access rights to. You can change the actual server message instead of just changing a copy. This includes text (font size and type) or lifetime of any message.

Benefits of Symon Design Studio Lite:

- Easy to publish pre-built emergency and ad-hoc messages
- Access from any Web-browser
- Quick and easy mechanism to change content
- Low learning curve

Technical Specifications

Symon Design Studio Lite is easily accessed from popular Web browsers like IE, Firefox and Safari.
